Project Design Phase

Proposed Solution

Date	September 2026
Project Name	ServiceNow-Based Employee Laptop Request Application

Proposed Solution Template

The proposed solution is a centralized ServiceNow-based application designed to simplify employee laptop requests by providing a guided request process, automated approvals, real-time status tracking, secure access controls, notifications, and improved IT fulfillment.

S.No.	Parameter	Description
1.	**Problem Statement (Problem to be solved)**	Employees may experience delays, incomplete information, multiple approval steps, and limited visibility when requesting laptops. A standardized and transparent process is required to simplify submission, approval, tracking, and fulfillment.
2.	**Idea / Solution description**	Develop a ServiceNow-based Employee Laptop Request Application with a guided request form, laptop catalogue, business-justification capture, automated approval routing, real-time status tracking, email notifications, asset availability checks, and IT fulfillment updates.
3.	**Novelty / Uniqueness**	The solution combines request submission, approval management, status visibility, security, and fulfillment in one workflow. Guided questions reduce incomplete requests, while automated routing and real-time tracking reduce manual follow-ups and improve transparency.
4.	**Social Impact / Customer Satisfaction**	The application improves the employee experience by making laptop requests easier to submit, providing clear approval and delivery updates, reducing uncertainty, and minimizing repeated communication with IT teams. It also helps IT teams manage requests more consistently.

5.	**Business Model (Revenue Model)**	The application is primarily an internal enterprise solution that creates business value through process efficiency rather than direct customer revenue. Benefits include reduced manual effort, faster request processing, better asset utilization, fewer follow-ups, and improved IT productivity.
6.	**Scalability of the Solution**	The ServiceNow workflow can be extended to support additional devices and services such as monitors, mobile devices, software, and accessories. Role-based access, reusable workflows, integrations, dashboards, and cloud-based ServiceNow capabilities support growth across departments and larger employee populations.
